

Specification and Planning

A critical part of ensuring that the design intent is achieved in construction is the development of appropriate and realistic specifications.

Specifications must ensure that the foundation meets safety and serviceability requirements, but is not onerous or impose unreasonable or impractical conditions.

Foundation QA assists owners with the development of specifications which strike the balance between the needs of both Owners and foundation contractors.

Foundation QA also assist with development of foundation project mindmaps which highlight all the issues which must be addressed in construction planning, and develop electronic construction proformas to assist with the quality assurance process.
