

Training Workshops

Foundation QA provides training workshops in all aspects of High Strain Dynamic Pile Testing internationally through its sister company Foundation QC.

Public workshops are generally conducted twice annually in the US, and in Asia/Middle East and once in Europe. The public workshops have two distinct audiences:

- the general engineering fraternity wishing to gain an overview of and insight into dynamic pile testing. The popular “Everything you wanted to know about PDA Testing but were too afraid to ask” is directed at this audience.

- PDA testers wishing to improve their skills in data acquisition and interpretation. Dr. Seidel uses extensive training resources to provide instruction in various aspects of PDA testing including GRLWEAP, field procedures, PDA data acquisition and interpretation, and CAPWAP.

Foundation QA also provides intensive in-house workshops by special request.

The workshops are held in conjunction with the High Strain Dynamic Pile Testing Examination and Certification program.
